

ABSTRACT OF THE DISCLOSURE

A system and method for attaching a related document to a primary document which includes at least one word. The system includes a processor
5 determining whether the plurality of words in the primary document includes an indicator that the related document should be attached to the primary document. If an indicator is detected, the related document is then attached to the primary document for further processing. The processor may also identify at least one of a filename and a location of the related document to provide further functionality. Thus, the present
10 invention substantially reduces the likelihood of the primary document being unintentionally processed without the related document attached thereto.
